1. WHAT IS RED TONGUE REFACTORY?

RedTongue Refactory is an advanced AI-powered development environment designed to help you write, refactor, test, and manage code with intelligent assistance. Think of it as having a team of expert programmers working alongside you.

Key Features:

- **AI Agents:** Smart assistants that understand your code and can suggest improvements, fix bugs, or explain complex sections.
- **ToolLayer:** A powerful set of commands that let the AI interact with your files, run shell commands, install packages, and more.
- **Five Specialized Decks:** Different workspaces optimized for specific tasks like coding, downloading media, testing, and managing libraries.
- **RAG System:** Retrieval-Augmented Generation that helps the AI understand your entire codebase by indexing and searching through your files.

2. INSTALLATION & SETUP

Requirements:

- Python 3.8 or higher
- pip (Python package manager)
- Git (optional, for version control features)

Step 1: Install Dependencies

Open your terminal or command prompt and run:

```
pip install PyQt6 sentence-transformers yt_dlp aiohttp requests gitpython
```

Note: yt_dlp is optional and only needed if you plan to use the Ripper deck for downloading media.

Step 2: Configure API Keys

Create a config.json file in the project directory with your API keys:

```
{ "api_key": "your-openai-api-key-here", "model": "gpt-4" }
```

Step 3: Run the Application

```
python main.py
```

3. MAIN INTERFACE OVERVIEW

When you launch RedTongue Refactory, you'll see a sleek, dark-themed interface divided into several sections:

Left Panel - File Explorer:

Browse your project files in a tree view. Click on any file to open it in the editor.

Center Panel - Code Editor:

Edit your code with syntax highlighting. The editor supports multiple file types and provides real-time feedback on syntax errors.

Right Panel - AI Chat:

Interact with the AI agents here. Type your questions or commands, and the AI will respond with suggestions, explanations, or execute tools on your behalf.

Bottom Panel - Console/Output:

View the output of executed commands, tool results, and system messages.

Top Menu - Deck Launcher:

Access the five specialized decks: Focus Studio, Ripper, Alchemist, Crucible, and PyLib.

4. THE FIVE DECKS

4.1 Focus Studio

Your primary coding environment. Use Focus Studio for:

- Writing and editing code
- Getting AI-assisted refactoring suggestions
- Running linters and formatters
- Managing project structure

Tip: Use Ctrl+Enter to send your current selection to the AI for quick analysis.

4.2 Ripper (Media Downloader)

Download audio and video content from over 100 supported websites including YouTube, Vimeo, SoundCloud, and more.

How to use:

1. Paste the URL of the video/audio you want to download
2. Choose your preferred format (MP4, MP3, WAV, etc.)
3. Select quality settings
4. Click Download

LEGAL NOTICE: This tool is NOT intended for downloading copyrighted materials. Only download content you have the right to access or that is available under appropriate licenses (Creative Commons, public domain, etc.). You are solely responsible for complying with copyright laws.

4.3 Alchemist (Code Transformer)

Transform code between languages, frameworks, or paradigms. The Alchemist can:

- Convert Python to JavaScript (and vice versa)
- Migrate code between framework versions
- Refactor code to follow design patterns
- Optimize performance-critical sections

4.4 Crucible (Testing Environment)

Run tests, benchmarks, and validations in an isolated environment.

- Execute unit tests with detailed reports
- Run performance benchmarks
- Validate code against coding standards
- Debug issues with step-through execution

4.5 PyLib (Library Manager)

Manage Python packages and dependencies for your projects.

- Install, update, or remove packages
- Create and manage virtual environments
- Export requirements.txt files
- Check for security vulnerabilities in dependencies

5. AI AGENT SYSTEM

RedTongue uses a sophisticated multi-agent system to assist you:

AgentSwarm:

Coordinates multiple AI agents working together on complex tasks. When you ask a question, the Swarm determines which agent is best suited to answer.

FailoverStack:

Ensures reliability by automatically switching to backup models or strategies if the primary agent fails or times out.

RAG (Retrieval-Augmented Generation):

Indexes your codebase to provide contextually relevant answers. Instead of generic responses, the AI can reference your actual code, variable names, and project structure.

DiagnosticBrain:

Specializes in identifying bugs, performance issues, and security vulnerabilities. It analyzes error messages and stack traces to provide targeted solutions.

6. TOOLLAYER COMMANDS

The ToolLayer provides the AI with capabilities to interact with your system. Here are the key commands:

File Operations:

- **read_file(path)** - Read contents of a file
- **write_file(path, content)** - Write content to a file
- **list_files(directory)** - List files in a directory
- **search_files(pattern, directory)** - Search for files matching a pattern

Code Analysis:

- **analyze_code(file_path)** - Analyze code for issues
- **get_imports(file_path)** - Extract import statements
- **find_symbol(symbol_name)** - Find where a symbol is defined
- **lint_file(file_path)** - Run linter on a file

System Operations:

- **run_shell(command)** - Execute shell commands
- **install_package(package_name)** - Install Python packages
- **git_status()** - Check Git repository status
- **get_system_info()** - Get system information

RAG Operations:

- **index_project()** - Index the entire project for RAG
- **query_rag(question)** - Ask questions about indexed code
- **rebuild_index()** - Rebuild the RAG index from scratch
